

## Plug connections for VW-Audi

In order for the alternator dash light on VW and Audi vehicles to turn off, the following must be done:

1. The single wire from the adapter plug must be plugged into the original harness. Insert the small spade connector into the original plug "L" slot as shown and tape it off so as not to allow it to accidentally come out.
2. Add the second wire and connect it to a switched ignition source that has power in the "RUN" position **ONLY**.
